SYSTEM ENGINEERING

Multiphysic modeling	6 credits	72,75h
Digital signal acquisition architectures and computed controlled systems	4 credits	60h
Hardware	4 credits	55h
Power systems and instrumentation	7 credits	85,5h
Improving autonomy and building a professional project	4 credits	39h
Communicating within organizations	6 credits	75h

Non-contractual information.

Multiphysic modeling

ECTS
6 credits

Component
INSTITUT NATIONAL DES SCIENCES APPLIQUEES TOULOUSE

Number of hours
72,75h

Presentation

Objectives

To design and analyse high-level models of multidomain energy-transfer

systems or mechatronic systems.

Formalisation of physics concepts from previous years as lumped-parameter

modelling (0D-1D) in electrical, magnetic, hydraulic, thermal and

mechanical systems. Lectures, tutorial, lab-work with Modelica or Amesim.

Implementation and analysis of multiphysics systems with block diagrams and

state-space simulation models. Several modelling problems using lumped

parameter systems: setting to equations in various domains, simulation using

simulink, time and frequency analysis. Lectures, tutorials, lab-with Matlab /

Simulink or Amesim.

Defining and designing models using the bond-graph formalism.

Lectures and modelling project

Pre-requisites

General physics (mechanics, electricity, fluid mechanics, thermodynamics).

INSTITUT NATIONAL DES SCIENCES APPLIQUEES TOULOUSE

Number of hours
60h

Presentation

Description

Programme (detailed contents):

Lecture is divided in three complementary axes:

* **Electronics design**: different techniques used in analog and digital converters, with their associated architectures are detailed. Companding techniques are presented (A–law). The complete chain gauging techniques are studied based on the signal noise ratio extraction.
* **Command design**: discrete time linear models: input/output model, state space models. Sampling with zero holder. Stability criteria. How to obtain a discrete time controller from a continuous time one. RST controller: Regulation and tracking. Relation with state space methods.
* **Project**: the purpose is to cover several items such as treating an analogue sensor, controlling an A/N converter, the necessary digital processing (minimal control law) and finally the N/A conversion to drive the actuator. The whole chain will be operated by a microcontroller.

Objectives

At the end of this module, the student will have understood and be able to explain (main concepts):

The complete modelling from sensor to actuator is presented, associated with digital control technics. A specific labwork deal with the implementation of a complete chain of acquisition and digital processing in order to carry out the control of an actuator.

Presentation

Description

Programme (detailed contents):

* System Design part:

The lecture begins with a presentation of the object paradigm. In this part, many various examples are given to illustrate the object world: systems of services or software and hardware systems. The second part deals with the specificity of an object-oriented design process. This process is compared to a functional approach. The lecture moves on to an UML introduction. The last part details the most widely used UML diagrams. It starts with use case and sequence diagrams, then structure (class and composite structure) diagrams are studied. Finally, behaviour (state and activity) diagrams are presented. Students assess their knowledge with exercises and labworks during which they have to model several complex systems.

* Programming of microcontroller part :

The functions and the programming of the STM32 (based on a ARM/CortexM3 core) is studied essentially in labwork. Half of time is devoted to a project. This project consists with the software development of an embbeded system embarked.

Organisation:

The 2 parts are held in parallel and are the subject of distinct evaluations

Objectives

At the end of this module, the student will have understood and be able to explain (main concepts):

* Programming of microcontroller part :
  * Programming specificities of the peripheral units for microcontroller.
  * How to take into account hardware constraints for the design of embedded system.
* System Design part:
  * o the concepts of object paradigm.
  * o the concepts of object-oriented design process
  * o the main UML diagrams involved in an object modelling: use case diagram, sequence diagram, state and activity diagram and composite structure diagram.

The student will be able to:

- * Programming of microcontroller part :
  - * To select an architecture processor adapted to the software application and to the process configuration.
  - * To conceive and test the techniques of the programming by hardware interruption.
  - * To use debug tools o and test in the context of cross-development.
  - * To find information into datasheet.
- * System Design part:
  - * o breakdown a system (which could be software or hardware) with an object-oriented approach
  - * o choose the diagrams which are most appropriated according the student viewpoint: structure, behaviour, interaction

propose an object-oriented UML model of a software or hardware system

Power systems and instrumentation

ECTS
7 credits

Component
INSTITUT NATIONAL DES SCIENCES APPLIQUEES TOULOUSE

Number of hours
85,5h

Presentation

Objectives

To be able to identify standard power transmission architectures. To be able to generate

or to analyse architectures of power systems

To acquire a global knowledge in the technology for power transmission (mechanical,

hydraulic, electrical and thermal). To able to characterise them with respect to

performance, advantages and drawbacks.

Acquire knowledge in measurement and computer-controlled data acquisition:

-selection and design of the components involved in an acquisition circuit

- use a graphical programming language dedicated to data acquisition (Labview).

Pre-requisites

1D multiphysics

Electro-kinetics. Algorithms and textual language programming (C, ADA)

INSTITUT NATIONAL DES SCIENCES APPLIQUEES TOULOUSE

Number of hours
39h

Presentation

Objectives

Construire une équipe projet, Approfondir ses connaissances,

Investir le métier, les domaines d'activité, les fonctions.

L'étudiant devra être capable de :

- d'analyser avec les autres un problème posé (Identifier le problème, définir les axes d'approche dans un bilan interactif : organisation, physique, technique, stratégique, motivation, confiance...

- de décider ensemble (permettre à tout le monde d'exprimer son avis, ajuster et réguler sa conduite en fonction de l'analyse collective),

- d'identifier les ressources du groupe (sens critique, repérage des points forts et faibles de chacun).

Presentation

Objectives

The classes given in French will focus on :

- How to react to society's demand for technical and scientific information

- How to foster critical thinking in order to give appropriate answers when questioned about such issues

- How to communicate effectively in the workplace

The classes given in English will focus on the specific linguistic characteristics of English used in such contexts in order for the students to understand and master them.

The students will also be made aware of the specificity of professional communication within the English-speaking world

Module L2

The objectives, defined in reference to the CEFRL for the 5 language activities, depend on the language studied - Chinese, German, Spanish - and the level of the student.

They can be consulted on :

https://moodle.insa-toulouse.fr/course/view.php?id=44

In certain cases, students may be authorised to follow an English module instead of another language.

Pre-requisites

For classes in English : mastery of general English.
