Introducing

Objectives

This course allows crossing advanced technical knowledge on various key areas addressed in the other classes, in an urban project linked to the development of a neighborhood in the urban area of Toulouse. It is about understanding how technical constraints can become an element of design. It is also a question of integrating interdisciplinary approaches to make a global diagnosis, define territorial issues, and make coherent development proposals.

2. This workshop helps to understand the process of developing an urban project, from the diagnosis to the public space design. In particular, it involves understanding two important elements: the interference of scales (the need to work at the same time on a large and a small scale) and the issue of an iterative work process (need to pose early working hypotheses, project "intuitions" at the same time as a diagnosis is drawn up).
