Introducing

Objectives

At the end of this module, the student will have understood and be able to explain (main concepts):

- Nanotechnological processes for the investigation, the sensing and the quantification of biomolecular specific interactions, basis of all biosensing technologies.

- The principle of some of these technologies: Fluorescence, soft lithography, surface biofunctionalization, single molecule assays, biochips, 3D lithography, microfluidic.

The student will be able to:
- Formulate nanoscale mechanisms and give precise examples of biomolecular specific interactions
- Master nanoscale technics for transducing a molecular event into a measurable signal
- Analyze any kind of biosensor
- Implement a scientific experimental investigation
-Implement these nanotechnological and fluidic processes
- Discuss results, give interpretations and set the l advantages as well as limitations,
- Gather different concepts; assimilate them for being able to extract them from their context in order to face adidactical situations.

Necessary prerequisites

- Initiation to micro/nano-biotechnologies
- Scientific M1 in Chemistry, Biology or Physics
